HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

IRAKAZI: a web-based system to assess the learning process of Basque language learners

Keywords: Intelligent Computer Assisted Language Learning (ICALL); Natural Language Processing (NLP); interlanguage; error analysis; learner corpora.

ABSTRACT

IRAKAZI is a teacher oriented web-based system designed for the study of Basque learners' learning process. The system involves a wide background in NLP tools, error detection and ICALL environments and it is easily transferable to other languages. IRAKAZI is composed of three modules:

In the *knowledge base* module, developed as a MySQL database, teachers record specific data about learners (age, language background, language level, learning context, etc.) and store students' deviations. This way, they collect learner corpora to study Basque learners' interlanguage levels and to investigate which can be the most suitable strategies to help students improve their language knowledge. Besides, we have developed ERREUS (Arrieta *et al.*, 2003), a database to store an exhaustive description of errors which includes technical and linguistic information for automatic error treatment. Both sources of knowledge have been linked. This way, the deviations added in IRAKAZI are actually stored in ERREUS. And therefore, they share some data, giving us a double perspective: the psycholinguistic and computational approaches of each error instance.

The *consulting tools* module includes a Java interface where NLP tools have been adapted, tools such as a morphological proposer, monolingual and multilingual dictionaries, a morphological analyzer to detect both correct and incorrect words, a verb conjugation tool, a lexical database, a declension tool, and a KWIC (Key Word In Context) application.

The user-friendly *interface* is based on Zope technology. It has a public site for teachers to consult learners' progresses and to study the characteristics which will help to define interlanguage levels. And a private site for experienced teachers to add and update the *knowledge base*.

Soon, IRAKAZI will be linked to IDAZKIDE (Díaz de Ilarraza. *et al.*, 1999), a student oriented ICALL environment for Basque learning. We are also developing a tool for automatic generation of language exercises to be integrated in the same environment. Our aim is to develop a complete and helpful ICALL environment for both Basque teachers and learners.
